Source: York Region Planning Department based on Statistics Canada data and CMHC Housing Completion data.

Note: Population figures include an adjustment for the Census undercount.

The population estimates are calculated by the following method:

- a) Occupied households from the 2006 Census are used as the base.
- b) CMHC housing completion data is added to the 2006 occupied households.
- c) A person per unit factor by household type is applied to the occupied household estimates to derive a population estimate.
- d) An estimate of the population in institutions is then added to the preliminary population estimate.
- e) An undercount adjustment is then applied to generate a final population estimate.

The population estimates do not include an analysis of migration and natural increase data nor do they account for changes that may occur to the person per unit factors.
